

HairOriginals AI Try-On → DC CRM

To: Ishan, Digicuro CRM team

From: HairOriginals AI Try-On app team

Date: 22 July 2026

Re: Two CRM-side changes now that leads are flowing

Hi Ishan,

The integration is live and leads are landing on the HairOriginals tenant — thank you. Two things we'd like your team to action on the CRM side. Neither needs a change to what we send (details below).

1. Show the source as "HairOriginals AI Try-On" (not "Vendor / Other")

What we see now: leads from our app are categorized as **Vendor (Other) / Partner** in the CRM.

What we want: they should show under a distinct source **"HairOriginals AI Try-On"**, so your agents can immediately tell these leads come from the AI Try-On funnel.

What we already send: every payload carries this at the top level, exactly as your spec asked:

```
{
  "event": "lead.created",
  "source": "HairOriginals AI Try-On",
  ...
}
```

Our ask: please create/configure an **"AI Try-On" source type (or channel)** in the CRM and map our leads to it — either by mapping our vendor connector, or by keying on the **source** value **"HairOriginals AI Try-On"** we already send. If you'd rather we send a specific value or a different field to trigger the right category, tell us the exact field + value and we'll adjust our payload.

2. Show the try-on images in a dedicated section on the lead

Good news — the expiry problem is fixed on our side. Earlier our image links were signed URLs that expired in ~30 days. We've replaced them with **stable, non-expiring URLs**: each points at our app (<https://aitryon.hairoriginals.com/api/crm-media/<id>/result>) and transparently redirects to a fresh image on every request. **They**

will not go dead — you can rely on them long-term and do **not** need to re-host the images. They are direct-loadable image URLs (they work in a plain ``).

What we want: a dedicated section on the lead — e.g. **"AI Try-On Looks"** — that displays these images so your agents can see what the customer generated.

Where the URLs are in the payload: inside the `metadata` object:

Field	What it is
<code>metadata.generatedLookUrl</code>	the customer's latest AI-generated look (main image to show)
<code>metadata.originalPhotoUrl</code>	the customer's original photo for that look (before/after pair)
<code>metadata.looks[]</code>	up to 5 recent looks for a gallery — each has <code>resultUrl</code> , <code>originalPhotoUrl</code> , <code>productName</code> , <code>createdAt</code>

Example (abridged):

```
"metadata": {
  "generatedLookUrl": "https://aitryon.hairoriginals.com/api/crm-media/7a1c9d20.../result
  "originalPhotoUrl": "https://aitryon.hairoriginals.com/api/crm-media/7a1c9d20.../source
  "looks": [
    {
      "resultUrl":      "https://aitryon.hairoriginals.com/api/crm-media/7a1c9d20.../re
      "originalPhotoUrl": "https://aitryon.hairoriginals.com/api/crm-media/7a1c9d20.../so
      "productName": "Silk Base Topper",
      "createdAt": "2026-07-22T10:11:40.000Z"
    }
  ]
}
```

Our ask: please add UI on the lead/touchpoint to render these — at minimum `metadata.generatedLookUrl`, ideally the `metadata.looks[]` gallery with the before/after (original → result) pair per look.

Happy to hop on a quick call if either is easier to scope live.

Thank you,
Aniket Singh
